

Statement from Defkalion Green Technologies, August 8, 2011.

The invention of Andrea Rossi received international doubt due to its ground-breaking nature having the capacity to change the global energy sector. Tremendous efforts have been made by Andrea Rossi to establish credibility for his invention as well as by Defkalion to support him in this endeavor.

During the months since January 2011, both interested parties (Andrea Rossi through EFA and Defkalion Green Technologies) have received very strong international pressure and to many degrees business traps from banks, financial partners, etc. to cancel the project.

The business implications of this project on international energy interests are tremendous and have created tensions establishing a business-as-unusual environment. Defkalion maintains its capability to handle these pressures, and stands next to Andrea Rossi who is apparently also facing similar challenges.

Defkalion believes in Andrea Rossi, his invention, and the ability to successfully bring to the world this revolutionary invention where society will benefit from cheaper energy, and so too the planet from cleaner energy.

Any project with such dire and earthmoving implications is bound to face difficulties – this was expected and has been, to-date, faced bravely and carefully by Defkalion Green Technologies.

We remain confident in the future, we remain confident in our long-standing partnership with Andrea Rossi, and we remain committed to materialize the project – despite all the existing and continuing pressures to discredit and eliminate the work done by Andrea Rossi and Defkalion Green Technologies.
